The Ancient Earth

“All we have are these stupid tantalizing zircons and the scars on the face of the Moon.”

- Earth was bombarded during and shortly after accretion by **asteroids and comets**.
- The **record** of the origin of the Earth and of the origin of life has **been destroyed** by geologic processes.
- Meteorites tell us that these bodies **delivered water and organics** to the early Earth.
- Meteorites are **not well connected** to their parent and **quickly become contaminated**.

EXTRATERRESTRIAL SAMPLES

Scott Messenger and Danny Glavin collecting a meteorite. Dante Lauretta (background) searching with a metal detector.

SAMPLE RETURN MISSIONS: THE GIFT THAT KEEPS ON GIVING

- Moon (1969-72, 1976)
NASA Apollo 11, 12, 14, 15, 16, and 17
Soviet Luna 16, 20, and 24
- Solar wind (returned 2004)
NASA Genesis
- Comet tail (returned 2006)
NASA Stardust
- Stony Asteroid (returned 2010)
JAXA Hayabusa
- Carbonaceous Asteroid
JAXA Hayabusa2 (launch 12/14)
NASA OSIRIS-REx (launch 9/16)

SOME HAVE BEEN VISITED

BUT ONLY ONE IS IDEAL

BENNU IS AN EXCELLENT TARGET

- **Very low albedo**, 4% and **low density**, 1 g/cc.
- **Organic-rich meteorites** are the best spectral analogs.
- There is strong evidence for **loose rocks** (regolith) for collection.
- The **orbital parameters** are well characterized.
- **Potentially Hazardous** (1:2700 chance of impacting in the late 22nd century) Asteroid.

*Some asteroid spectral classifications (440-920 nm): B C Cb Cg Cgh Ch

BENNU IS EXTENSIVELY CHARACTERIZED

- **Discovered** on Sept. 11, 1999 by the LINEAR survey
- **Observed** with the Arecibo Planetary Radar system in Sept. 1999 and Sept. and Oct. 2005 (also with Goldstone)
- **Observed** with the Kuiper 1.5-m telescope multiple times in Sept., Oct. 2005, Sept. 2011
- **Observed** with the NASA Infrared Telescope Facility in Sept. 1999, Sept. 2005, and August 2011
- **Observed** with the Spitzer Space Telescope between May 2007
- **Observed** with the Herschel Space Observatory, Giant Magellan Telescope, and WHT in Sept. 2011
- **Observed** with Hubble and Spitzer August and Sept. 2012

CHARACTERIZATION GREATLY LOWERS RISK

Comet 67P/Churyumov-Gerasimenko

WHO IS OSIRIS-REx?

Principal Investigator: Dante Lauretta (UA)
Deputy PI: Edward Beshore (UA)
First PI: Mike Drake (UA, deceased)
Project Manager: Mike Donnelly (GSFC)
Flight System Manager: Rich Kuhns (LM)

Lockheed Martin Space Systems

- Flight System
- Sampling System
- Sample Return Capsule
- Mission Operations

Canadian Space Agency – OSIRIS-REx Laser Altimeter (OLA)

Arizona State University – OSIRIS-REx Thermal Emission Spectrometer (OTES)

KinetX – Navigation/Flight Dynamics

Johnson Space Center – Sample Curation

Indigo Information Services – PDS Archiving

University of Arizona

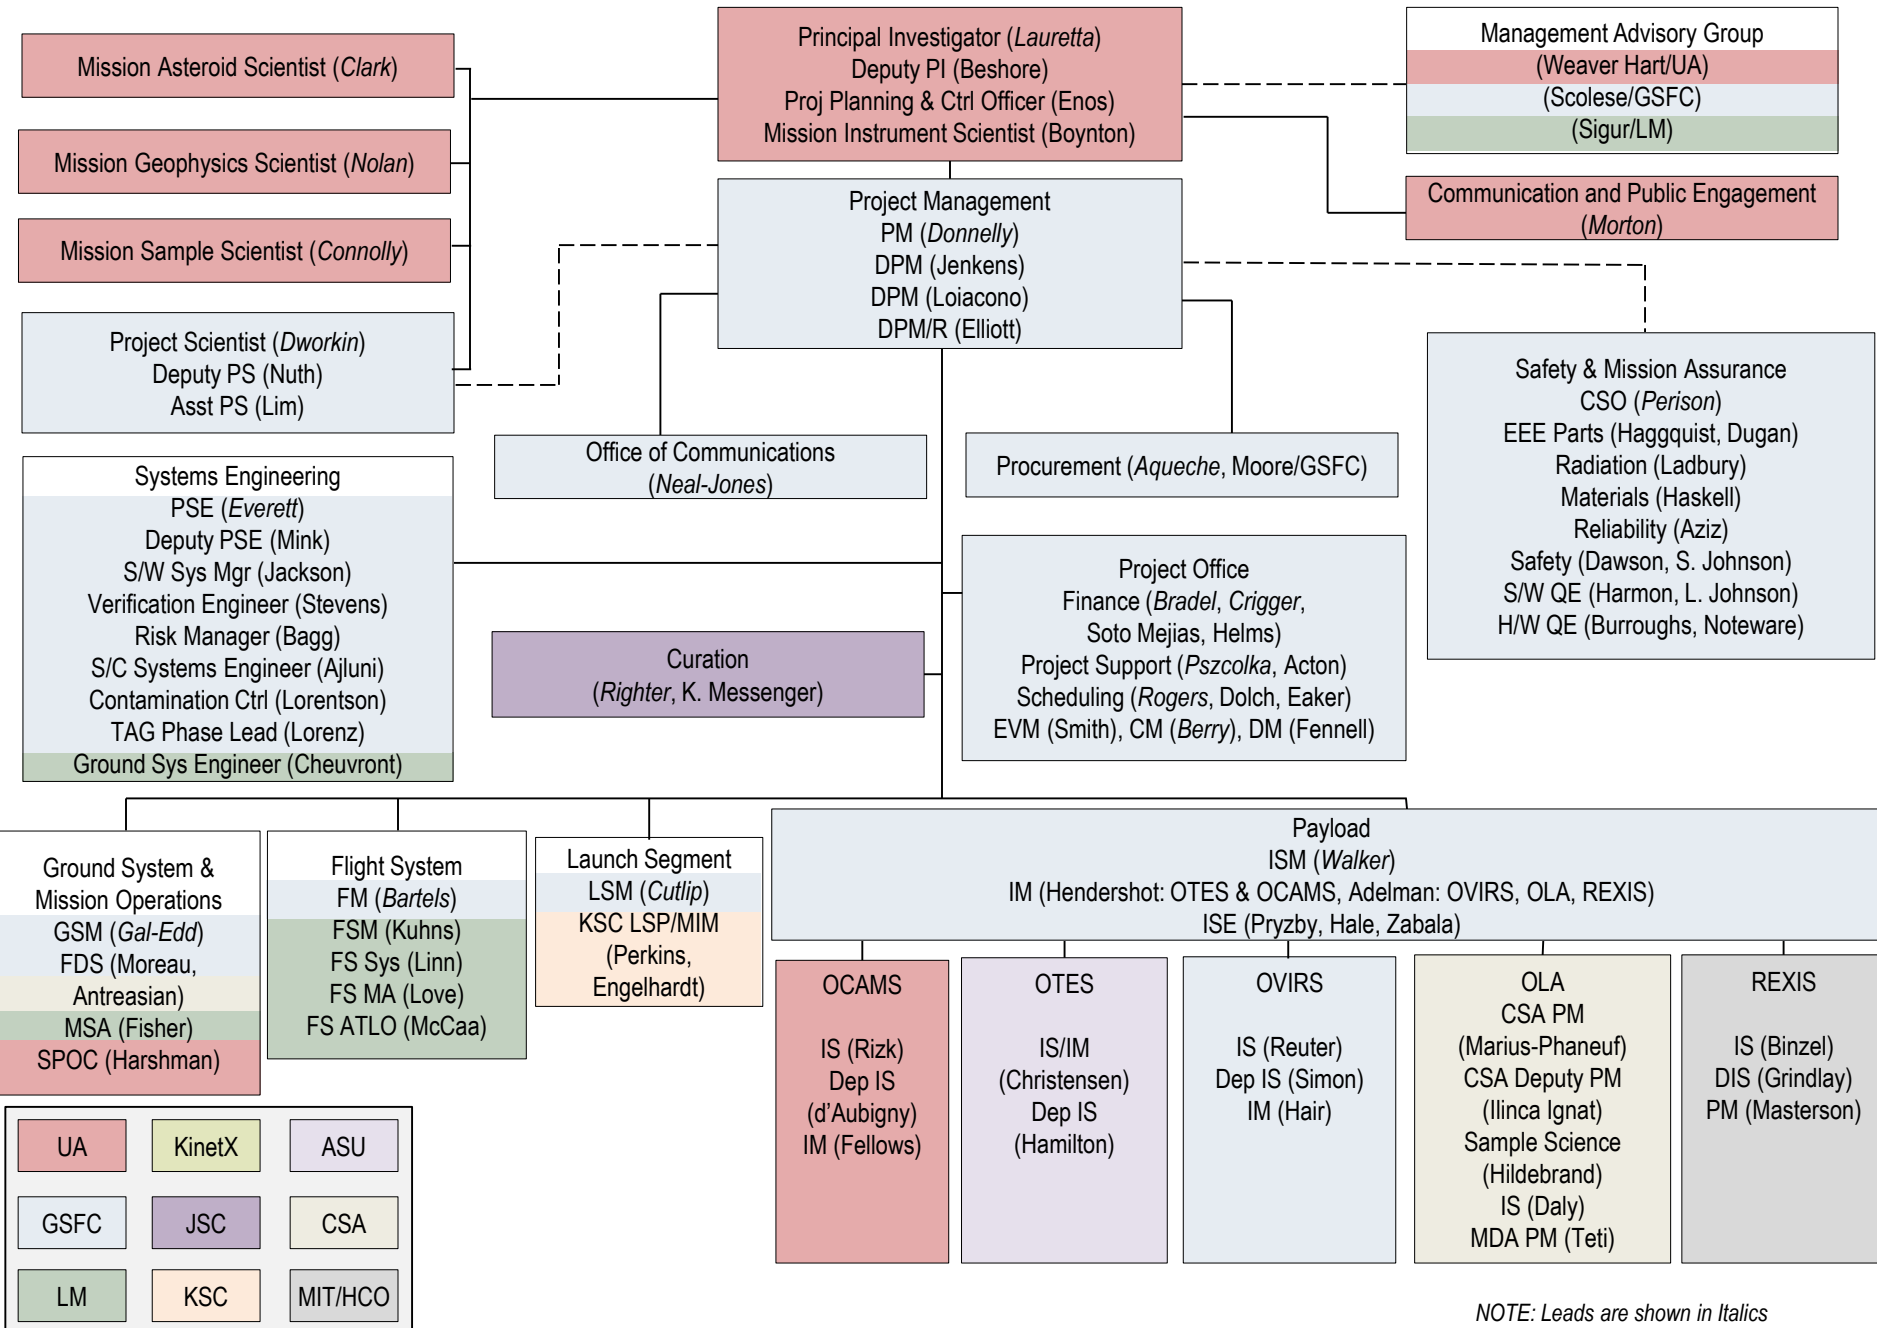

- Principal Investigator & Deputy PI
- Project Planning and Control Officer
- Mission Instrument Scientist
- Science Team Management
- OSIRIS-REx CAMera Suite (OCAMS)
- Science Processing and Operations Center (SPOC)
- Data Management and Archiving
- Community and Public Engagement

NASA Goddard Space Flight Center

- Project Management
- Project Scientist & Deputy Project Scientists
- Mission Systems Engineering
- Safety & Mission Assurance
- OSIRIS-REx Visible and near Infrared Spectrometer (OVIRS)
- Flight Dynamics Lead

OSIRIS-REx Project Organization (C/D)

WHAT IS OSIRIS-REx?

Origins

- Return and analyze a sample of pristine carbonaceous asteroid regolith

Spectral Interpretation

- Provide ground truth for telescopic data of the entire asteroid population

Resource Identification

- Map the chemistry and mineralogy of a primitive carbonaceous asteroid

Security

- Measure the Yarkovsky effect on a potentially hazardous asteroid

Regolith Explorer

- Document the regolith at the sampling site at scales down to the sub-cm

MISSION OBJECTIVES

1. Return and Analyze a Sample
2. Provide Sample Context
3. Understand Asteroid Geology, Dynamics, and Spectroscopy
4. Understand the Interaction Between Asteroid Thermal Properties and Dynamics
5. Improve Asteroid Astronomy

Earth return, Utah
8:53 am September 24, 2023

MISSION OBJECTIVES

1. Return and Analyze a Sample

- The sample must be kept pristine for modern lab analyses.

2. Provide Sample Context

3. Understand Asteroid Geology, Dynamics, and Spectroscopy

4. Understand the Interaction Between Asteroid Thermal Properties and Dynamics

5. Improve Asteroid Astronomy

Earth return, Utah
8:53 am September 24, 2023

DEFINING PRISTINE

- **Totally clean is impossible**

- In the strictest sense contamination is any alteration of the physical, chemical, textural, or other sample state that compromises sample integrity.
- Alteration includes changing inherent states, losing sample components, or adding extraneous components,
 - e.g. changes in bulk chemistry/mineralogy, trace components, stable isotopic ratios, volatiles (ices, organics), crystallinity and phase state, remnant magnetism, grain-size distribution, grain/clast integrity, texture/structure/layering, and chemical/electronic activation state.
- ***Our focus is on the addition of organics, isotopes, and trace elements***

- **Contamination of the sample can occur at any time and mitigation needs to be planned from day 1**

- Thus, there is no point being cleaner than conditions of curation

- **The spacecraft still has to work, so contamination can be relaxed under contingency via graceful descopes**

- A contaminated sample is better than a failed mission

DRIVERS FOR CONTAMINATION CONTROL (CC)

Species	Indicator	Limit Derived from Chondrites (µg/g [%])	TAGSAM Surface Limit Requirement (ng/cm ²)
Amino Acids	Biological contaminant, special for astrobiology	20 [30%]	180
Hydrazine	Reduces organics	nd	180
C	Organics	32 [10%]	1000
K	Lithophile	5.4 [1%]	170
Ni	Siderophile	1100 [10%]	34,000
Sn	Industrial contaminant	0.017 [1%]	0.53
Nd	Lanthanide lithophile	0.047 [1%]	1.5
Pb	Chalcophile, special for chronology	0.025 [1%]	0.79

Still too many species to verify during Assembly Test and Launch Operations (ATLO) on critical surfaces: TAGSAM head, TAGSAM launch container, Sample Return Canister (SRC)

TRANSLATING SCIENCE TO ENGINEERING

We converted the science derived contamination control concentrations to the engineering standard, IEST-STD-CC1246D, assuming the worse-than-worst case assumptions that all particles and films are pure elements.

Particle Results

worst case

Measured in bins of maximum particle size for theoretical IEST-STD-CC1246D

Particle Level	Graphite (ng/cm ²)	Particle Level	Lead (ng/cm ²)
level 25	0.20	level 25	1.1
level 50	2.43	level 50	13
level 100	33.8	level 100	182
level 200	556	level 200	2996
level 500	40230		

Film Results

worst case

Measured in fractions of A of non-volatile residue.

Since the testing method produces a mass/area² the conversion is not based on density of material.

level	mg/dm ²	μg/cm ²	ng/cm ²
B	2	2	2000
A	1	1	1000
A/2	0.5	0.5	500
A/5	0.2	0.2	200
A/10	0.1	0.1	100
A/100	0.01	0.01	10
AA3	0.001	0.001	1

100 A/2 + 180 ng/cm² amino acids achieves our science CC requirements except in pathological cases

TRANSLATING ENGINEERING BACK TO SCIENCE

100 A/2 + 180 ng/cm² amino acids achieves our science CC requirements except in pathological cases

Surface	Amino Acids	Carbon (from 100 A/2)	K, Ni, Sn, Nd, Pb
Requirement	180 ng/cm ²	1000 ng/cm ²	Anomalies?
G TAGSAM Head	0.96	281	No
G SRC	13.1	503	No
G Launch Container	2.32	134	No

Contamination Knowledge demonstrated the lack of pathological cases
GSFC Lab analyses showed outstanding amino acid performance
LM analyses showed NVR and Particulate below carbon requirements

OSIRIS-REx MISSION PLAN

SPACECRAFT

INSTRUMENTS PLACE THE SAMPLE IN CONTEXT

OVIRS (GSFC) maps the reflectance albedo and spectra from 0.4 – 4.3 μm

OTES (ASU) maps the thermal flux and spectra from 5 – 50 μm

OCAMS (UA) **PolyCam** >500K-km range, high-resolution imaging of the surface, **SamCam** images the sample site and TAG, **MapCam** provides landmark-tracking, filter photometry.

OLA (CSA) ranging to 7 km and maps the asteroid shape and surface topography

REXIS (MIT) Student Experiment maps the elemental abundances

Radio Science (CU) reveals the mass, gravity field, internal structure, and surface acceleration distribution
